Six Conundrums of Global Identity

1

Immutable linking to the device
Does the third-party know, with a defined level of certainty /trust, who (or which entity) is making the assertion(s)?

2

Global BYOiD
Will the US accept Chinese iD and vice versa?

3

Persona Based Identity
Is identity based on personas, housed in multiple locations of my choice, ensuring my attributes cannot easily be aggregated?

Bring Your Own Identity

Assertion of attributes from authoritative sources
Are the attributes of the entity asserted from their authoritative source, thus minimising / eliminating the liability problem?

4

Privacy enhancing
Can I control where my personas are held?

5

Extensible to anywhere that needs identity
Are devices, form-factors and communications extensible to work with anything and anywhere?
